

CALL FOR PAPERS

Plant Physiology

Announces a Reactive Oxygen Species Special Issue

Plant Physiology is planning a special issue devoted to Reactive Oxygen Species in June 2006. All excellent papers covering reactive oxygen species signaling and metabolism, oxidative stress homeostasis, and redox signaling research in plants will be considered.

Authors interested in contributing to this special issue should indicate this in their cover letter when submitting papers online at <http://submit.plantphysiol.org/>. Manuscripts to be considered for the special issue should be submitted no later than January 31, 2006. For additional information, please contact Editor-in-Chief Donald Ort (d-ort@uiuc.edu) or Special Issue Editors Julia Bailey-Serres (serres@ucr.edu) and Ron Mittler (ronm@unr.edu).

ASPB Open Access Option

The Open Access movement in scholarly publishing advocates that research content should be freely available to all immediately upon publication. This approach has prompted publishers to examine the feasibility of a shift from traditional subscription-based (“user pays”) financial models to an “author-pays” model, in which some or all of the costs of publication are typically borne by authors.

What does our author community think about Open Access? To gauge the plant science community’s interest in this new approach to publishing and to help ASPB determine the viability of “author-pays” publishing models, the Society is conducting an 18-month Open Access “experiment.” Beginning with the December 2005 issues of *The Plant Cell* and *Plant Physiology*, authors of articles accepted by the journals will be given the option to pay a surcharge to make their online article free from the moment of publication to anyone with Internet access. The surcharge, which is in addition to the usual author charges, will be \$1,000 (discounted to \$500 if the author’s institution subscribes to the journal).

For more information, go to <http://www.aspb.org/publications/openaccess.cfm> or contact Nancy Winchester, ASPB director of publications, at nancyw@aspb.org.

P-**PER**

Grasp the Proteome®

Plant Cell Lysis

Is your plant cell lysis leafing you out in the cold?

The P-PER® Reagent Kit† (#89803) extracts maximum active protein from stem, root, seed and leaves in 10 minutes without liquid nitrogen.

You can trust the experts at Pierce to know how to get maximum protein extraction from your sample. We have been the protein people for over 50 years, providing the best solutions to extract, purify and quantify proteins from many types of cell lines and tissue.

P-PER® Reagent Kit Highlights:

- **Convenient** – disrupts cells without harsh mechanical methods in 10 minutes
- **Compatible** – downstream applications include 1-D and 2-D gel electrophoresis, Western blotting, activity assays, and protein affinity purifications
- **Quantifiable** – use the BCA™ Protein Assay Kit, Reducing Agent Compatible†
- **Ready-to-use** – extract does not require filtration through cheesecloth or Miracloth
- **Provides active proteins** – extracted proteins are functional

Fresh leaf tissue and seed were lysed and extracted according to the P-PER® Kit (Product # 89803) protocol, a competitor's protocol and a literature-based (home brew) protocol. Samples were normalized (weight tissue/volume extract), resolved on a 10% Bis-Tris gel and stained with Imperial™ Protein Stain† (Product # 24615). Samples were also quantified using the BCA™ Protein Assay Kit, Reducing Agent Compatible (Product # 23250).

*The Competitor S kit is not recommended for dried seed.
