**ON THE COVER**

As key components in the eukaryotic gene regulatory network, microRNAs (miRNAs) themselves are regulated at the levels of both metabolism and functioning. Wang et al. (pages 3565–3576) utilized an *Arabidopsis thaliana* transgenic line expressing an artificial miRNA (amiR-trichome) that causes trichome clustering to identify factors that are involved in modulating miRNA activity. They showed that mutations in an Importin  $\beta$  protein enhanced miRNA activity and caused highly clustered trichomes as shown in the cover image.
