ON THE COVER

The floral homeotic protein AGAMOUS directs the specification of reproductive organs by controlling the expression of a plethora of other regulators. O’Maoléidigh et al. (pages 2482–2503) identify the direct and indirect downstream targets of AGAMOUS during reproductive organ specification on a genome-wide scale. The cover shows the indeterminate flower of an ag-1 mutant plant in which the reproductive organs, stamens, and carpels have been replaced by sepals and petals.
